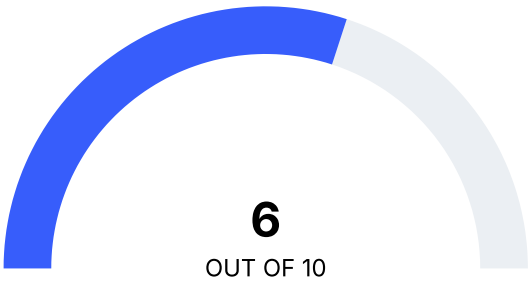
Candidate name	Job Title	Date
Rachit Srivastava	Sr. Software Engineer - Fullstack	Monday, February 16th, 2026

Assessment

Interview score **6** OUT OF 10

AI Summary



Technical Skill	3 / 5
Problem Solving	3 / 5
Code Quality	3 / 5
Communication Rating	4 / 5

Interview Summary

Language/Framework... 3

Software Engineering 3

Frontend Concepts 2

HIGHLIGHTS

Good comm skill and project understanding
Good in EF core
Good in SQL server concepts and query writing
Good in Microservices
Good in thread and concurrency in .net

Overall candidate is good and should be given chance for next round of evaluation
Bit low in angular and Azure

SCOPE OF IMPROVEMENT

Average in Angular concepts
Knows well about Angular Services, observables and subjects
Bit low in Angular coding
Not aware with use case of asObservable
Not aware with use case of takeuntil RXJS Operator
Average in in Azure concepts

Language/Framework Fundamentals

C# | ENTITY FRAMEWORK | MVC

3 OUT OF 5
Performance Meets Expectations

OVERALL FEEDBACK

Good in EF core
Good in JWT tokens concepts
Good in Microservices
Good in thread and concurrency in .net
good in Azure concepts

Candidate has Good knowledge

QUESTION 1

You are working on an Order Processing API.

When a new order is created:

A record is inserted into the Orders table

A record is inserted into the OrderLogs table

Your code looks like this:

```
context.Orders.Add(order);
context.OrderLogs.Add(log);
context.SaveChanges();
```

What happens in this situation?

Will the first insert remain in the database?

Or will both inserts be rolled back?

Why?

FEEDBACK

Knows it well

Candidate has Basic knowledge

QUESTION 2

would there be any (Lock) Performance Issue under below Scenario:
where To fix race condition, someone added:

```
private static object _lock = new object();

public void Increment()
{
   lock(_lock)
   {
      Counter++;
   }
}
```

Under heavy load, performance dropped significantly.

Questions:

Why does performance degrade?

What is lock contention?

What alternative would you suggest?

Would ConcurrentDictionary help here?

When should you avoid lock?

FEEDBACK

Knows about locks and the challenges with the current code
knows about the threads will wait here due to this lock if there are multiple (say 100 request)
Knows about `ConcurrentDictionary and its use case`
`Not aware with` Interlocked

Candidate has No knowledge

QUESTION 3

A request passes through multiple middlewares (auth, validation, logging).
One middleware throws an error.
How does it is decided which middleware runs next?

FEEDBACK

Not aware with Error middleware and how it works

Candidate has Basic knowledge

QUESTION 4

Scenario: You want to track audit fields like CreatedBy, CreatedDate automatically f or all entities. How will you do that?

FEEDBACK

Knows about it

Candidate has Good knowledge

QUESTION 5

Your .NET API allows multiple users to update the same resource. Sometimes one u ser overwrites another's changes. How can you prevent this?
If User A and User B both load the same customer record:

User A changes Name → "John" and saves.

User B changes Email → "john@email.com" and saves.

Without concurrency control, User B's save will overwrite User A's Name change (be cause the whole row is updated).

FEEDBACK

Knows about how to handle it using RowVerssion optimistic consurrency

Software Engineering

3 OUT OF 5
Performance Meets Expectations

OVERALL FEEDBACK

Good in SQL Inding concepts and queries
good query writing skills
Average in Azure concepts

Good in JWT concepts

Candidate has Good knowledge

QUESTION 1

Customer Who Visited but Did Not Make Any Transactions: Write a solution to find t he IDs of the users who visited without making any transactions and the number of t imes they made these types of visits.

https://leetcode.com/problems/customer-who-visited-but-did-not-make-any-trans actions/description/

FEEDBACK

Solved it correctly

CANDIDATE CODE

```
  Select
s.customer_id, Count(s.visit_id) As count_no_trans
From Visits s
Left Join Transactions t
On s.visit_id = t.visit_id
Where t.transaction_id is null
Group by s.customer_id
```

Candidate has Good knowledge

QUESTION 2

You have an orders table with frequent reads and writes.
How do you design indexes without hurting write performance?

FEEDBACK

Knows it well

Candidate has Good knowledge

QUESTION 3

A user's role changes, but existing JWTs are still valid.
How would you handle this scenario?

FEEDBACK

Good understanding of JWt and how to invalidate the jwt token basis need

Candidate has Good knowledge

QUESTION 4

A single user request passes through multiple microservices: API Gateway, Order, P ayment, and Inventory. The overall response time is high. How would you trace this request across services to identify the bottleneck?

FEEDBACK

Knows about how to use correlation id for debugging

Candidate has No knowledge

QUESTION 5

You notice duplicate messages in your Azure Service Bus queue. What steps will yo u take to investigate and prevent this?

FEEDBACK

Not well aware with it

Frontend Concepts

2 OUT OF 5

Performance Is Average

OVERALL FEEDBACK

Average in Angular concepts
not aware with use case of asObservable
Not aware with use case of takeuntil

Candidate has Basic knowledge

QUESTION 1

Create an angular todo application with complete CRUD operation using Angular se rvices?
Please use services , observables and subjects where ever possible ?

FEEDBACK

Knows about basic of observables, services and BehaviourSujects

coding has some issue like `BehaviorSubject` is never emitting the actual `todos` array
not aware with use case of asObservable
Not aware with use case of takeuntil

Candidate has Good knowledge

QUESTION 2

When would you choose @ViewChild instead of @Input/@Output?

FEEDBACK

Knows about @input /output and view child decorator and its usecase
