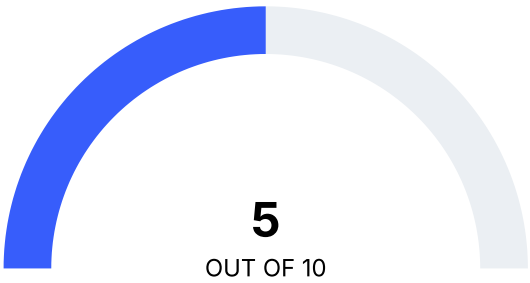
Candidate name	Job Title	Date
Sumit Singh Deo	Sr. Software Engineer - Fullstack	Wednesday, February 25th, 2026

Assessment

Interview score **5** OUT OF 10

AI Summary



Technical Skill	3 / 5
Problem Solving	2 / 5
Code Quality	2 / 5
Communication Rating	3 / 5

Interview Summary

Language/Framework... 3

Software Engineering 3

Frontend Concepts 2

HIGHLIGHTS

Good comm skills
good in project understanding
Good in language fundamental and async
await concepts
good in middleware and filters
Average in EF core
Average in database concept

SCOPE OF IMPROVEMENT

Bit average in react concepts

Language/Framework Fundamentals

C# | ENTITY FRAMEWORK | MVC

3 OUT OF 5
Performance Meets Expectations

OVERALL FEEDBACK

Good in language fundamental and async await concepts
good in middleware and filters
Average in EF core

Candidate has Good knowledge

QUESTION 1

What's the difference between middleware and a filter in ASP.NET Core?
Can Filters replace Middleware?
What is the use case of resource filters?
Difference between next() in Middleware vs next() in Filters

FEEDBACK

knows about Middleware and filters
Not aware with resource filters

Candidate has Basic knowledge

QUESTION 2

would there be any (Lock) Performance Issue under below Scenario:
where To fix race condition, someone added:

```
private static object _lock = new object();

public void Increment()
{
```

```
    lock(_lock)
    {
        Counter++;
    }
}
```

Under heavy load, performance dropped significantly.

Questions:

Why does performance degrade?

What is lock contention?

What alternative would you suggest?

Would ConcurrentDictionary help here?

When should you avoid lock?

FEEDBACK

Knows about it

Candidate has Good knowledge

QUESTION 3

A user's role changes, but existing JWTs are still valid.
How would you handle this scenario?

FEEDBACK

Knows about JWT tokens and how to invalidate it
Knows about session based authentication

Candidate has Good knowledge

QUESTION 4

if i am downloading a large file in web API core. what will happen if i close the brows er?

FEEDBACK

knows about cancellation token to avoid the situation

Candidate has Good knowledge

QUESTION 5

How does Parallel.ForEach() differ from Task.WhenAll()?
How to call multiple downstream services in parallel?
Scenario (Order → Inventory service + Payment service)

FEEDBACK

Knows when about task.whenALL and parallel.foreach

Candidate has Good knowledge

QUESTION 6

How does async await works ?
How do you handle deadlock in async await code?

FEEDBACK

Knows ait well

Candidate has No knowledge

QUESTION 7

Scenario: You want to track audit fields like CreatedBy, CreatedDate automatically f or all entities. How will you do that?

FEEDBACK

Not aware with it

Candidate has Good knowledge

QUESTION 8

Your .NET API allows multiple users to update the same resource. Sometimes one u ser overwrites another's changes. How can you prevent this?
If User A and User B both load the same customer record:

User A changes Name → "John" and saves.

User B changes Email → "john@email.com" and saves.

Without concurrency control, User B's save will overwrite User A's Name change (be cause the whole row is updated).

FEEDBACK

knows about it

Software Engineering

3 OUT OF 5

Performance Meets Expectations

OVERALL FEEDBACK

Knows about Microservices tracing
good in Api gateway use case
Average in Azure Function/Lambda concepts
Average in Database indexing stretegy

Candidate has Basic knowledge

QUESTION 1

You are building a Payment API. A client retries the same request due to network fail ure.

Questions:

How will you ensure the payment is not processed twice?

Where will you store idempotency keys?

What HTTP method is correct here?

When should you return 200 vs 201 vs 409?

FEEDBACK

Knows the basics only
not aware with how to handle situation to stop multiple payment execution

Candidate has Good knowledge

QUESTION 2

A single user request passes through multiple microservices: API Gateway, Order, P ayment, and Inventory. The overall response time is high. How would you trace this request across services to identify the bottleneck?

FEEDBACK

Knows about it

Candidate has Basic knowledge

QUESTION 3

You need to design a solution where users upload images, and the system should re size, apply watermarks, and store the result. How would you implement this using A zure Functions or Lambda function?
Would you use Durable Functions here? Why or why not?

FEEDBACK

Knows basics of Lambda function / azure function

but not aware with how to handle this situation
bit low in durable function understanding /implementation

Candidate has Basic knowledge

QUESTION 4

How does SQl handle concurrent access to the database?
tell me how does transactions, locks, and isolation levels works ?

FEEDBACK

knows about locks but not aware with Isolation level

Candidate has Basic knowledge

QUESTION 5

Describe how you would handle service versioning in a microservices architecture. Suppose You're designing a REST API in .NET Web API for a product-based microse rvice.

v1 should offer only basic API functionality

v2 should offer basic + premium functionality

v3 should offer all features (basic + premium + exclusive)

Using URL-based versioning (/api/v1/products, /api/v2/products, /api/v3/products):

How would you design and implement this versioning strategy?

How would you handle shared logic across versions?

How would you document it in Swagger/OpenAPI?

What are pros and cons of URL-based versioning compared to other strategies?

FEEDBACK

Knows about versioning concepts
not sure on how to handle shared logic thing

Frontend Concepts

2 OUT OF 5
Performance Is Average

OVERALL FEEDBACK

Poor in react concepts

Candidate has No knowledge

QUESTION 1

When would you choose Context API over Redux, and when would Redux be a bette r choice?

FEEDBACK

Not much sure on use case of context API vs redux

Candidate has No knowledge

QUESTION 2

A Context-based state update is causing the entire app to re-render. How would you optimize this?

FEEDBACK

Not aware with it

Candidate has No knowledge

QUESTION 3

A child component re-renders every time the parent renders, even when props do n't change. How would you fix this using hooks?

FEEDBACK

Not able to handle this scenario
Not aware with react.memo

Candidate has Basic knowledge

QUESTION 4

What is the difference between props and state in React, and when should props be converted into state? Explain with a real-world example and common pitfalls."

FEEDBACK

Knows about difference between props and state
Not aware with "when should props be converted into state"
